

STUDENT ENROLLMENT & COURSE MANAGEMENT SYSTEM (SECMS)

Salesforce Administrator Project with AI Agentforce

Project Title	Student Enrollment & Course Management System (SECMS)
Platform	Salesforce
Project Area	Salesforce Administration & Automation
Student Name	Yoganandham P.
Course / College	B.Sc. Computer Science – III Year
Project Status	Completed / Ready for Demonstration

Submitted as a project document for the Salesforce SECMS implementation.

1. Introduction

Student Enrollment & Course Management System (SECMS) is a Salesforce-based application developed to manage student records, courses, instructors and enrollments in one place. The project uses Salesforce objects, validation rules, flows, approval processes, reports, dashboards and security settings to reduce manual work and organize the enrollment process.

2. Problem Statement

In a manual enrollment process, student and course information may be maintained in different places. This can cause duplicate records, delayed approvals, difficulty in tracking enrollments and problems in reporting. SECMS provides a centralized Salesforce solution for these activities.

3. Objectives

- Manage student information in a centralized system.
- Create and manage course and instructor records.
- Process student enrollment requests.
- Automate important enrollment activities using Salesforce Flows.
- Use validation rules to prevent incorrect data.
- Manage enrollment approval and rejection.
- Create reports and dashboards for monitoring.
- Provide suitable access through Salesforce security settings.

4. Technology Used

Area	Technology
Application / UI	Salesforce Lightning
Database	Salesforce Custom Objects
Automation	Salesforce Flow
Validation	Validation Rules
Approval	Salesforce Approval Process
Reporting	Reports & Dashboards
Security	Profiles, Permission Sets & Sharing Settings
AI	Salesforce Agentforce (project scope)

5. Salesforce Data Model

The project uses four main custom objects: Student, Course, Instructor and Enrollment. Enrollment connects the student, course and instructor records through lookup relationships.

Object	Main Purpose
Student	Stores student personal and contact details.

Course	Stores course name, category, duration, fee and description.
Instructor	Stores instructor name, code, expertise and contact details.
Enrollment	Stores student enrollment, course, instructor, status, fees and comments.

6. Main Features Implemented

- Student, Course, Instructor and Enrollment custom objects.
- Custom fields and lookup relationships.
- Custom tabs and a Lightning application.
- Enrollment record types for New Enrollment and Re-Enrollment.
- Student email domain validation.
- Fee validation before enrollment approval.
- Automatic enrollment date population.
- Email notification after enrollment approval.
- Automatic instructor assignment based on course category.
- Automatic follow-up Task for requested enrollments.
- Enrollment approval and rejection process.
- Reports for students, enrollments, pending approvals and revenue.
- Student Management Dashboard.
- Profiles, permission sets and organization-wide sharing settings.

7. Automation / Flow Details

Flow	Purpose
SetEnrollmentDate	Sets enrollment date when an enrollment is created.
Enrollment Approved Action	Sends notification and updates the student status.
AutoAssign_Instructor	Assigns an instructor according to course category.
Create_Followup_Task	Creates a follow-up task when an enrollment is requested.

8. Reports and Dashboard

Reports created:

- Students by Status
- Enrollments by Course
- Pending Enrollment Approvals
- Revenue Report – Fees Paid

The Student Management Dashboard uses charts and a table to display student status, enrollments by course, revenue and pending approvals.

9. Security Setup

- Admin – full access to the application.
- Enrollment Officer – create and update enrollment records.
- Instructor – read-only access to relevant enrollment information.
- Permission Sets can provide additional object or dashboard permissions.
- Organization-Wide Defaults are configured for Student, Course and Enrollment objects.

10. Testing

The project should be tested by creating sample student, course, instructor and enrollment records and checking the validation rules, approval process, flows, reports, dashboard and user access. Screenshots of successful tests are maintained as project evidence.

12. Conclusion

The Student Enrollment & Course Management System provides a centralized way to manage students, courses, instructors and enrollments using Salesforce. The project demonstrates the use of Salesforce administration features such as custom objects, relationships, validation rules, flows, approval processes, reports, dashboards and security. The system can be extended in the future with payment gateway integration, a student self-service portal, advanced analytics and mobile access.

13. Future Scope

- Payment gateway integration.
- Student self-service portal.
- Analytics-driven insights.
- Mobile access support.
- Further Agentforce-based assistance and automation.
